***ABSTRACT***

*The results of this research show that in variable customs deal with the test positive and significant effect of stress on college students ' regular accounting. Whereas, in the accounting student employees on a visit to the library's influential variable is positive and significant stressor in College. each custom variable is facing increasing test on accounting student and regular visits to the library on the variable of student accounting employees then stress College will increase. because  $F$  calculate  $< F$  table then the hypothesis is accepted or the stress function of College between regular employees does not differ significantly.*

*Keywords: Behavioral learning, emotional intelligence, stress in College*
