Title : Design and Making Application Of Information
Systems Mini Soccer Field Based On Android Mobile

Mini soccer is a sport that is gaining in popularity and is in great demand by football fans today. Even so, the availability of mini soccer sports is still very minimal and the lack of an information system regarding field rentals is one of the problems that needs to be addressed. It is inversely proportional to the availability of futsal fields which are so abundant in every region in DKI Jakarta. Based on this phenomenon, Mini soccer sports fans are constrained to get complete information about the location of the field, rental price and facilities available in the field. Therefore the author intends to make it easier for mini soccer lovers to get complete information about mini soccer fields around the DKI Jakarta area.

The author is interested in analyzing and designing a mobile phone application system that contains a summary of complete information from several mini soccer fields in the DKI Jakarta area, like field location, field rental prices telephone numbers and facilities provided by the mini soccer field provider. Therefore Mini soccer sports fans can easily find the nearest field location without having to absorb wider information from the internet in general. In addition, field providers will be helped in terms of the publication of business leasing mini soccer fields. In this application the author also utilizes the Global Positioning Systems (GPS) method that has been integrated in mobile devices based on the Android operating system, namely the google maps API.

Key words :

Mini Soccer; Informasi; Android
