Abstract - UT School is a subsidiary of a large company, PT United Tractors. UT School has students who are very reliable in dealing with the problems of heavy equipment, because of the disciplines of mechanical engineering and basic theory. To support the basic theory, students need a schedule to regulate things - things that must be learned day by day. In looking at the lesson schedule students still have to ask the schedule directly by going to the instructor who feels in the room of the instructor. To make it easier for students and instructors to know the schedule, a daily schedule system will be developed that was previously based on excel and than became a web. The application was developed using php language because in using php language it would be easier to create a basic web. And for databases using phpmyadmin. In this case UT School uses a web-based application to help and make it easier to view the daily schedule and apply the SDLC method to look back at the application developed. This paper aims to build a scheduling application that is supported by data management facilities to input schedule from Excel to the database.
